Fractions: The Building Blocks of Understanding

Fractions are a cornerstone of 6th-grade math. Students are expected to not only understand what fractions represent but also to perform operations with them, including addition, subtraction, multiplication, and division. This is often where students need extra practice and a solid grasp of the concepts.

Adding and Subtracting Fractions

The key to adding and subtracting fractions lies in finding a **common denominator**. This means making sure both fractions have the same bottom number (the denominator) before you can combine or separate the top numbers (the numerators).

Problem Example: Sarah has $\frac{1}{2}$ of a pizza and her friend gives her another $\frac{1}{4}$ of the same pizza. How much pizza does Sarah have in total?

Answer Breakdown: 1. **Identify the fractions:** We have $\frac{1}{2}$ and $\frac{1}{4}$. 2. **Find a common denominator:** The smallest number that both 2 and 4 divide into evenly is 4. 3. **Convert $\frac{1}{2}$ to an equivalent fraction with a denominator of 4:** To get from 2 to 4, we multiply by 2. So, we must also multiply the numerator by 2: $(1 \times 2) / (2 \times 2) = \frac{2}{4}$. 4. **Add the fractions:** Now we have $\frac{2}{4} + \frac{1}{4}$. Since the denominators are the same, we add the numerators: $(2 + 1) / 4 = \frac{3}{4}$. **Solution:** Sarah has $\frac{3}{4}$ of the pizza.

Problem Example: John had $\frac{7}{8}$ of a chocolate bar. He ate $\frac{1}{4}$ of it. How much chocolate does he have left?

Answer Breakdown: 1. **Identify the fractions:** We have $\frac{7}{8}$ and $\frac{1}{4}$. 2. **Find a common denominator:** The smallest number that both 8 and 4 divide into evenly is 8. 3. **Convert $\frac{1}{4}$ to an equivalent fraction with a denominator of 8:** To get from 4 to 8, we multiply by 2. So, multiply the numerator by 2: $(1 \times 2) / (4 \times 2) = \frac{2}{8}$. 4. **Subtract the fractions:** Now we have $\frac{7}{8} - \frac{2}{8}$. Since the denominators are the same, we subtract the numerators: $(7 - 2) / 8 = \frac{5}{8}$. **Solution:** John has $\frac{5}{8}$ of the chocolate bar left.

Multiplying Fractions

Multiplying fractions is actually quite straightforward! You simply multiply the numerators together and multiply the denominators together. Don't forget to simplify if possible.

Problem Example: A recipe calls for $\frac{2}{3}$ cup of flour. If you want to make $\frac{1}{2}$ of the recipe, how much flour do you need?

Answer Breakdown: 1. **Identify the fractions:** We have $\frac{2}{3}$ and $\frac{1}{2}$. 2. **Multiply the numerators:** $2 \times 1 = 2$. 3. **Multiply the denominators:** $3 \times 2 = 6$. 4. **Combine:** This gives us $\frac{2}{6}$. 5. **Simplify:** Both 2 and 6 are divisible by 2. $2 \div 2 = 1$, and $6 \div 2 = 3$. So, $\frac{2}{6}$ simplifies to $\frac{1}{3}$. **Solution:** You need $\frac{1}{3}$ cup of flour.

Dividing Fractions

Dividing fractions involves a fun little trick: "Keep, Change, Flip." You keep the first fraction the same, change the division sign to multiplication, and flip the second fraction (find its reciprocal). Then, you multiply as usual.

Problem Example: You have $\frac{3}{4}$ of a gallon of paint. If each can holds $\frac{1}{8}$ of a gallon, how many cans can you fill?

Answer Breakdown: 1. **Set up the division:** We want to find out how many $\frac{1}{8}$ s fit into $\frac{3}{4}$, so it's $(\frac{3}{4}) \div (\frac{1}{8})$. 2. **Keep, Change, Flip:** * Keep $\frac{3}{4}$. * Change $\div$ to $\times$. * Flip $\frac{1}{8}$ to $\frac{8}{1}$. 3. **Multiply:** $(\frac{3}{4}) \times (\frac{8}{1})$ * Multiply numerators: $3 \times 8 = 24$. * Multiply denominators: $4 \times 1 = 4$. * This gives us $\frac{24}{4}$. 4. **Simplify:** 24 divided by 4 is 6. **Solution:** You can fill 6 cans.

Decimals and Percentages: The Other Side of the Coin

Decimals and percentages are closely related to fractions. Understanding how to convert between these forms and perform operations with decimals is crucial.

Converting Decimals to Fractions and Vice Versa

This is a fundamental skill. Remember that the place value after the decimal point tells you the denominator of the fraction.

Problem Example: Convert the decimal 0.75 to a fraction.

Answer Breakdown: 1. **Read the decimal:** 0.75 is read as "seventy-five hundredths." 2. **Write as a fraction:** This directly translates to $\frac{75}{100}$. 3. **Simplify:** Both 75 and 100 are divisible by 25. $75 \div 25 = 3$, and $100 \div 25 = 4$. **Solution:** 0.75 is equal to $\frac{3}{4}$.

Problem Example: Convert the fraction $\frac{2}{5}$ to a decimal.

Answer Breakdown: 1. **Divide the numerator by the denominator:** $2 \div 5$. 2. **Perform the division:** $2.0 \div 5 = 0.4$. **Solution:** $\frac{2}{5}$ is equal to 0.4.

Percentages: Understanding Parts Per Hundred

A percentage (%) simply means "out of 100." To convert a decimal to a percentage, you multiply by 100 (move the decimal point two places to the right). To convert a percentage to a decimal, you divide by 100 (move the decimal point two places to the left).

Problem Example: What is 60% of 200? **Answer Breakdown:** 1. **Convert the percentage to a decimal:** $60\% = 0.60$ or 0.6 . 2. **Multiply the decimal by the number:** 0.6×200 . 3. **Calculate:** $0.6 \times 200 = 120$. **Solution:** 60% of 200 is 120. **Problem Example:** If a shirt costs \$25 and is on sale for 20% off, how much is the discount? **Answer Breakdown:** 1. **Convert the percentage to a decimal:** $20\% = 0.20$ or 0.2 . 2. **Calculate the discount amount:** $0.2 \times \$25$. 3. **Calculate:** $0.2 \times 25 = 5$. **Solution:** The discount is \$5.

Ratios and Proportions: Finding Relationships

Ratios compare two quantities, and proportions state that two ratios are equal. These concepts are vital for understanding scaling and relationships in data.

Understanding Ratios

Ratios can be written in several ways: using a colon (e.g., 2:3), using the word "to" (e.g., 2 to 3), or as a fraction (e.g., $\frac{2}{3}$).

Problem Example: In a classroom, there are 12 boys and 18 girls. What is the ratio of boys to girls? **Answer Breakdown:** 1. **Identify the quantities:** 12 boys and 18 girls. 2. **Write the ratio:** Boys to girls is 12:18. 3. **Simplify the ratio:** Find the greatest common divisor (GCD) of 12 and 18, which is 6. Divide both numbers by 6: $12 \div 6 = 2$ and $18 \div 6 = 3$. **Solution:** The ratio of boys to girls is 2:3.

Solving Proportions

Proportions are often solved using cross-multiplication. If $\frac{a}{b} = \frac{c}{d}$, then $a \cdot d = b \cdot c$. **Problem Example:** If 3 apples cost \$2, how many apples can you buy for \$8? **Answer Breakdown:** 1. **Set up the proportion:** We are comparing apples to cost. Let 'x' be the number of apples. $(3 \text{ apples} / \$2) = (x \text{ apples} / \$8)$ 2. **Cross-multiply:** $3 \times 8 = 2 \times x$ 3. **Solve for x:** $24 = 2x$ $24 / 2 = x$ $x = 12$ **Solution:** You can buy 12 apples for \$8.

Introduction to Algebra: The Language of Variables

6th grade often introduces the concept of variables – symbols (usually letters) that represent unknown numbers. This is the gateway to algebra!

Understanding Variables and Expressions

An **expression** is a mathematical phrase that can contain numbers, variables, and operation signs. **Problem Example:** Write an expression for "the sum of a number and 5." **Answer Breakdown:** 1. **Identify the unknown:** "a number" can be represented by a variable, let's use 'n'. 2. **Identify the operation:** "the sum" means addition (+). 3. **Combine:** $n + 5$. **Solution:** The expression is $n + 5$. **Problem Example:** Write an expression for "twice a number decreased by 3." **Answer Breakdown:** 1. **Identify the unknown:** "a number" is 'x'. 2. **Identify the operations:** "twice a number" means 2 times x ($2x$). "decreased by 3" means subtracting 3. 3. **Combine:** $2x - 3$. **Solution:** The expression is $2x - 3$.

Solving Simple Equations

An **equation** is a statement that two expressions are equal, indicated by an equals sign (=). Solving an equation means finding the value of the variable that makes the equation true. **Problem Example:** Solve for y in the equation: $y + 7 = 15$. **Answer Breakdown:** 1. **Goal:** Isolate 'y' on one side of the equation. 2. **Inverse operation:** To undo adding 7, we subtract 7 from both sides of the equation. 3. **Perform the operation:** $y + 7 - 7 = 15 - 7$ $y = 8$ **Solution:** $y = 8$. **Problem Example:** Solve for m in the equation: $3m = 18$. **Answer Breakdown:** 1. **Goal:** Isolate 'm'. 2. **Inverse operation:** '3m' means 3 multiplied by m. To undo multiplication, we divide by 3. 3. **Perform the operation:** $3m / 3 = 18 / 3$ $m = 6$ **Solution:** $m = 6$.

Geometry Basics: Shapes and Measures

6th grade math also touches on the fundamentals of geometry, including calculating area and perimeter of basic shapes.

Perimeter and Area of Rectangles and Squares

Perimeter: The total distance around the outside of a shape. * Rectangle: $P = 2(\text{length} + \text{width})$ or $P = 2l + 2w$ * Square: $P = 4s$ (where s is the side length) **Area:** The amount of space inside a shape. * Rectangle: $A = \text{length} \times \text{width}$ ($A = l \times w$) * Square: $A = \text{side} \times \text{side}$ ($A = s^2$) **Problem Example:** A rectangular garden is 10 feet long and 5 feet wide. What is its perimeter and area? **Answer Breakdown:** **Perimeter:** $P = 2(10 + 5)$ * $P = 2(15)$ * $P = 30$ feet **Area:** $A = 10 \times 5$ * $A = 50$ square feet **Solution:** The perimeter is 30 feet, and the area is 50 square feet.

Statistics and Data Analysis: Making Sense of Numbers

Understanding how to interpret and represent data is a key skill developed in 6th grade.

Mean, Median, and Mode

These are measures of central tendency, giving us an idea of the "typical" value in a dataset. **Mean:** The average. Add all the numbers and divide by how many numbers there are. **Median:** The middle number when the data is arranged in order. **Mode:** The number that appears most frequently in the dataset. **Problem Example:** Find the mean, median, and mode of the following dataset: 10, 12, 15, 12, 11. **Answer Breakdown:** 1. **Order the data:** 10, 11, 12, 12, 15 2. **Mean:** * Sum: $10 + 11 + 12 + 12 + 15 = 60$ * Count: There are 5 numbers. * Mean = $60 / 5 = 12$ 3. **Median:** The middle number in the ordered list is 12. 4. **Mode:** The number that appears most often is 12 (it appears twice). **Solution:** The mean is 12, the median is 12, and the mode is 12.

For parents, educators, and students alike, navigating this new terrain can sometimes feel daunting. However, with a clear understanding of common **sixth grade math problems** and their corresponding **math answers**, this year can become a period of significant growth and confidence-building.

This detailed guide aims to demystify sixth-grade mathematics. We will explore the key areas students will encounter, provide illustrative examples of typical problems, and offer clear, step-by-step solutions. By understanding the underlying principles and practicing with targeted problems, students can develop strong problem-solving skills and excel in their math education. We'll also touch upon how these concepts build towards future mathematical endeavors.

The Pillars of Sixth Grade Math

Sixth-grade math curriculum typically builds upon the skills learned in previous grades, introducing new challenges that require deeper analytical thinking. Here are the core areas students will typically focus on:

1. **Number System Fluency:** This includes mastering operations with all rational numbers – positive and negative integers, fractions, and decimals. Students will also work with absolute value and the number line.
2. **Ratios and Proportional Relationships:** This is a crucial area where students learn to understand and represent

relationships between two quantities. They'll explore unit rates, equivalent ratios, and proportional reasoning.

3. **Expressions and Equations:** Sixth graders begin to work with algebraic expressions, simplifying them and evaluating them for given values. They also learn to solve one-step and two-step equations.
4. **Geometry:** This strand focuses on understanding geometric shapes, calculating areas, volumes, and surface areas of two- and three-dimensional figures.
5. **Statistics and Probability:** Students are introduced to basic statistical concepts like measures of central tendency (mean, median, mode) and data representation.

Deep Dive into Sixth Grade Math Problems and Answers

Let's break down each of these areas with specific problem examples and detailed answers. Understanding these will not only help students with their homework but also prepare them for standardized tests and future math courses.

1. Number System Fluency: Mastering Integers, Fractions, and Decimals

This year, students will tackle operations involving negative numbers. This is a significant conceptual shift and requires careful practice.

Problem Type: Operations with Integers

Problem 1: A submarine is at an elevation of -50 meters. It then ascends 20 meters. What is its new elevation?

Keywords: Integer addition, negative numbers, elevation, submarines.

Analysis: Ascending means moving upwards, which in the context of negative elevation translates to adding a positive number to a negative number.

Solution:

Initial elevation: -50 meters

Ascent: +20 meters

New elevation = $-50 + 20$

To add a positive and a negative number, we find the difference between their absolute values ($50 - 20 = 30$) and keep the sign of the number with the larger absolute value (which is -50).

Answer: The submarine's new elevation is -30 meters.

Problem 2: The temperature dropped from 5 degrees Celsius to -7 degrees Celsius overnight. By how many degrees did the temperature change?

Keywords: Temperature change, integer subtraction, degrees Celsius, calculating difference.

Analysis: To find the change, we subtract the initial temperature from the final temperature. This will involve subtracting a positive number from a negative number, or equivalently, adding the opposite.

Solution:

Initial temperature: 5 degrees Celsius

Final temperature: -7 degrees Celsius

Change in temperature = Final temperature - Initial temperature

Change = $-7 - 5$

Subtracting a positive is the same as adding its opposite:

Change = $-7 + (-5)$

Add the absolute values ($7 + 5 = 12$) and keep the negative sign.

Answer: The temperature changed by -12 degrees Celsius (it dropped by 12 degrees).

Problem Type: Operations with Fractions and Decimals

Problem 3: Sarah has $\frac{2}{3}$ of a pizza left. She eats another $\frac{1}{6}$ of the original pizza. How much of the pizza does she have left now?

Keywords: Fraction subtraction, common denominators, pizza problems, parts of a whole.

Analysis: We need to subtract a fraction from another fraction. To do this, we must find a common denominator.

Solution:

Amount of pizza Sarah has: $\frac{2}{3}$

Amount Sarah eats: $\frac{1}{6}$

To subtract, find a common denominator for 3 and 6. The least common multiple (LCM) is 6.

Convert $\frac{2}{3}$ to an equivalent fraction with a denominator of 6: $(\frac{2}{3}) * (\frac{2}{2}) = \frac{4}{6}$.

Now subtract: $\frac{4}{6} - \frac{1}{6} = \frac{3}{6}$.

Simplify the fraction: $\frac{3}{6}$ can be simplified to $\frac{1}{2}$.

Answer: Sarah has $\frac{1}{2}$ of the pizza left.

Problem 4: John bought 3.5 pounds of apples at \$2.40 per pound. How much did he spend?

Keywords: Decimal multiplication, cost calculation, pounds, price per pound, money math.

Analysis: This problem requires multiplying a decimal by a decimal to find the total cost.

Solution:

Weight of apples: 3.5 pounds

Price per pound: \$2.40

Total cost = Weight * Price per pound

Total cost = $3.5 * 2.40$

Multiply as if they were whole numbers: $35 * 240 = 8400$.

Count the total number of decimal places in the original numbers (one in 3.5 and two in 2.40, for a total of three decimal places).

Place the decimal point three places from the right in the product: 8.400.

Answer: John spent \$8.40 on apples.

2. Ratios and Proportional Relationships: Understanding Proportions

This is a foundational concept for understanding percentages, scaling, and many real-world applications.

Problem Type: Unit Rates

Problem 5: A bakery uses 5 cups of flour to make 10 dozen cookies. How many cups of flour are needed per dozen cookies?

Keywords: Unit rate, ratios, fractions, division, recipe scaling, baking math.

Analysis: We need to find out how much flour is used for *one* dozen cookies. This means we need to divide the total amount of

flour by the total number of dozens.

Solution:

Flour used: 5 cups

Number of dozens: 10

Unit rate (cups per dozen) = Total cups of flour / Total dozens

Unit rate = 5 cups / 10 dozens

Unit rate = 0.5 cups per dozen.

Answer: 0.5 cups of flour are needed per dozen cookies.

Problem Type: Equivalent Ratios and Proportional Reasoning

Problem 6: If 3 shirts cost \$45, how much would 7 shirts cost, assuming the price per shirt remains the same?

Keywords: Proportional relationships, equivalent ratios, cross-multiplication, word problems, linear relationships.

Analysis: The cost of shirts is directly proportional to the number of shirts. We can set up a proportion to solve this.

Solution:

Let 'x' be the cost of 7 shirts.

Set up the proportion: (Cost 1 / Number of shirts 1) = (Cost 2 / Number of shirts 2)

3 shirts / \$45 = 7 shirts / \$x

To solve for x, we can cross-multiply:

$$3 * x = 45 * 7$$

$$3x = 315$$

Now, divide by 3:

$$x = 315 / 3$$

$$x = 105$$

Answer: 7 shirts would cost \$105.

3. Expressions and Equations: The Beginnings of Algebra

This is where students start to use variables to represent unknown quantities and solve for them.

Problem Type: Evaluating Expressions

Problem 7: Evaluate the expression $3x + 5$ when $x = 4$.

Keywords: Algebraic expressions, substitution, order of operations (PEMDAS/BODMAS), evaluating variables.

Analysis: We substitute the given value for the variable and then follow the order of operations to find the result.

Solution:

Expression: $3x + 5$

Given: $x = 4$

Substitute 4 for x: $3(4) + 5$

Follow order of operations (multiplication before addition):

$$12 + 5$$

$$= 17$$

Answer: The expression evaluates to 17.

Problem Type: Solving One-Step and Two-Step Equations

Problem 8: Solve for y : $y - 9 = 15$

Keywords: One-step equations, inverse operations, addition property of equality, solving for variables.

Analysis: To isolate ' y ', we need to perform the inverse operation of subtraction, which is addition.

Solution:

Equation: $y - 9 = 15$

Add 9 to both sides of the equation to maintain equality:

$$y - 9 + 9 = 15 + 9$$

$$y = 24$$

Answer: $y = 24$.

Problem 9: Solve for n : $2n + 3 = 11$

Keywords: Two-step equations, inverse operations, subtraction property of equality, division property of equality, algebraic manipulation.

Analysis: This requires two steps: first, undo the addition, and then undo the multiplication.

Solution:

Equation: $2n + 3 = 11$

Step 1: Subtract 3 from both sides to isolate the term with ' n '.

$$2n + 3 - 3 = 11 - 3$$

$$2n = 8$$

Step 2: Divide both sides by 2 to solve for ' n '.

$$2n / 2 = 8 / 2$$

$$n = 4$$

Answer: $n = 4$.

4. Geometry: Understanding Shapes and Space

Sixth grade introduces more complex geometric calculations, moving beyond simple perimeter and area.

Problem Type: Area of Triangles and Composite Shapes

Problem 10: A triangular garden has a base of 12 feet and a height of 8 feet. What is the area of the garden?

Keywords: Area of a triangle, geometric formulas, base, height, agricultural math, calculating space.

Analysis: The formula for the area of a triangle is $(1/2) * \text{base} * \text{height}$.

Solution:

Base (b) = 12 feet

Height (h) = 8 feet

Area = $(1/2) * b * h$

Area = $(1/2) * 12 \text{ feet} * 8 \text{ feet}$

Area = 6 feet * 8 feet

Area = 48 square feet.

Answer: The area of the garden is 48 square feet.

Problem Type: Volume of Rectangular Prisms

Problem 11: A box has a length of 10 cm, a width of 5 cm, and a height of 6 cm. What is the volume of the box?

Keywords: Volume of a rectangular prism, 3D shapes, cubic units, packaging, storage solutions.

Analysis: The formula for the volume of a rectangular prism is length * width * height.

Solution:

Length (l) = 10 cm

Width (w) = 5 cm

Height (h) = 6 cm

Volume = $l * w * h$

Volume = 10 cm * 5 cm * 6 cm

Volume = 50 cm² * 6 cm

Volume = 300 cubic centimeters (cm³).

Answer: The volume of the box is 300 cm³.

5. Statistics and Probability: Understanding Data

This introduces students to how data is collected, organized, and interpreted.

Problem Type: Measures of Central Tendency

Problem 12: Find the mean, median, and mode of the following set of test scores: 85, 92, 78, 85, 90.

Keywords: Mean, median, mode, measures of central tendency, data analysis, test scores, statistical measures.

Analysis:

1. **Mean:** The average, found by summing all values and dividing by the number of values.
2. **Median:** The middle value when the data is ordered.
3. **Mode:** The value that appears most frequently.

Solution:

Data set: 85, 92, 78, 85, 90

Mean:

Sum = 85 + 92 + 78 + 85 + 90 = 430

Number of values = 5

Mean = $430 / 5 = 86$

Median:

First, order the data: 78, 85, 85, 90, 92

The middle value is 85.

Mode:

The number that appears most often is 85 (it appears twice).

Answer: The mean is 86, the median is 85, and the mode is 85.

Strategies for Success with Sixth Grade Math Problems

Accessibility features ensure broader participation. Adjustable displays and supportive reading tools help accommodate different needs, allowing more readers to engage comfortably.

Organization enhances continuity. Files remain available, categorized, and easy to retrieve. Progress is never lost, even when reading is paused for weeks or months.

The global nature of access adds another layer. Readers across different cultures encounter the same material, often interpreting it through unique experiences. This shared access strengthens collective understanding.

Revisiting familiar passages often reveals new insights. What once felt complex may later feel clear. Growth becomes visible through repeated engagement rather than rushed completion.

With 6th Grade Math Problems And Answers readily available, learning becomes less about finishing and more about returning. The book remains present, patient, and ready whenever attention shifts back.

This steady availability encourages a calmer relationship with knowledge. There is no pressure to absorb everything at once. Understanding unfolds naturally, shaped by time and reflection.

In this way, reading becomes less transactional and more personal. The value lies not only in information gained, but in the habit of thoughtful engagement that develops along the way.

Questions & Answers About 6th grade math problems and answers

No	Question	Answer
1	My 6th grader is struggling with fractions. Can you give me a common problem and a clear way to solve it?	A common problem is adding or subtracting fractions with different denominators. For example, $\frac{1}{2} + \frac{1}{4}$. The key is to find a common denominator. The least common multiple of 2 and 4 is 4. So, $\frac{1}{2}$ becomes $\frac{2}{4}$. Then, $\frac{2}{4} + \frac{1}{4} = \frac{3}{4}$. Always simplify your answer if possible!

2	What's a typical word problem involving percentages that 6th graders encounter, and how do I break it down?	A typical problem might be: 'A shirt costs \$20, and it's on sale for 10% off. What's the sale price?' First, calculate the discount: 10% of \$20 is $(10/100) * \$20 = \2 . Then, subtract the discount from the original price: $\$20 - \$2 = \$18$. The sale price is \$18.
3	My child is confused about order of operations (PEMDAS/BODMAS). Can you give an example and explain the steps?	Sure! Let's take $(5 + 3) * 2 - 10 / 5$. Remember PEMDAS: Parentheses, Exponents, Multiplication and Division (from left to right), Addition and Subtraction (from left to right). 1. Parentheses: $(5 + 3) = 8$. 2. Now we have $8 * 2 - 10 / 5$. 3. Multiplication/Division: $8 * 2 = 16$ and $10 / 5 = 2$. 4. Now we have $16 - 2$. 5. Subtraction: $16 - 2 = 14$. The answer is 14.
4	What's a common problem with ratios that 6th graders might face, and how can we solve it?	A common ratio problem involves scaling. If the ratio of boys to girls in a class is 2:3, and there are 12 girls, how many boys are there? Since the number of girls is 12 (which is $3 * 4$), we multiply the number of boys by the same factor: $2 * 4 = 8$ boys. So there are 8 boys.
5	My daughter is learning about decimals. Can you give a multiplication example and how to handle the decimal point?	Let's multiply $2.5 * 0.3$. First, multiply as if they were whole numbers: $25 * 3 = 75$. Then, count the total number of decimal places in the original numbers (one in 2.5 and one in 0.3, so two total). Place the decimal point in the answer so it has two decimal places: 0.75.
6	What's a typical problem involving area and perimeter for 6th grade, especially with rectangles?	A common problem is: A rectangle has a length of 8 cm and a width of 5 cm. What is its area and perimeter? Area = length * width = $8 \text{ cm} * 5 \text{ cm} = 40 \text{ sq cm}$. Perimeter = $2 * (\text{length} + \text{width}) = 2 * (8 \text{ cm} + 5 \text{ cm}) = 2 * 13 \text{ cm} = 26 \text{ cm}$.
7	How can I help my child understand negative numbers with a simple example?	Think of a number line. Zero is the middle. Numbers to the right are positive, and numbers to the left are negative. If you start at 0 and move 3 steps to the left, you are at -3. A simple problem: $5 - 8$. Starting at 5, move 8 steps to the left. You'll end up at -3.
8	My 6th grader is learning about variables. Can you give a simple algebraic equation and explain it?	A simple equation might be: $x + 5 = 12$. Here, 'x' is a variable, representing an unknown number. To solve for x, you want to get 'x' by itself. Since 5 is added to x, you subtract 5 from both sides of the equation: $x + 5 - 5 = 12 - 5$. This gives you $x = 7$. So, $7 + 5 = 12$.
9	What's a common problem involving finding the mean (average) and how is it calculated?	A typical problem: Find the mean of the following numbers: 10, 15, 20, 25. To find the mean, you add up all the numbers and then divide by how many numbers there are. Sum = $10 + 15 + 20 + 25 = 70$. There are 4 numbers. Mean = $70 / 4 = 17.5$.
10	My child is working on converting units, like feet to inches. Can you give an example and the conversion factor?	A common conversion is from feet to inches. There are 12 inches in 1 foot. So, if you need to convert 3 feet to inches, you multiply: $3 \text{ feet} * 12 \text{ inches/foot} = 36 \text{ inches}$. For inches to feet, you would divide.
