Step-by-Step Experimental Procedure (Example: Measuring Acceleration Due to Gravity)

Let's consider an example: Determining the acceleration due to gravity using a simple pendulum.

1. Apparatus: Pendulum bob, measuring tape, stopwatch, retort stand, clamp, and support.

2. Procedure:

- **Set up the pendulum by suspending the bob from the support.**
- **Measure the length of the pendulum (L) from the point of suspension to the center of the bob.**
- **Displace the bob slightly and release it.**
- **Start the stopwatch simultaneously as the bob starts oscillating.**
- **Measure the time taken for 20 oscillations (T).**
- **Repeat the experiment for at least 5 different lengths to obtain a range of data.**
- **Record all the data in the observation table.**

3. Calculations:

- Calculate the time period (T) for one oscillation by dividing the total time taken for 20 oscillations by 20.
- Calculate the square of the time period (T^2).
- Plot a graph of L (length) on the x-axis and T^2 (time period squared) on the y-axis.

4. Result: The graph obtained should be a straight line with a positive slope.

5. Conclusion: The slope of the graph is related to the acceleration due to gravity (g). Compare your experimental value with the theoretical value and analyze the source of error.
